¹ Naval ammunition depot, St. Julians Creek, 221.6 acres; navy yard, Norfolk, 261.6 acres—both largely covered by buildings and plants. Birds protected by order of Commandant, Fifth Naval District.

² There are four other national military parks which afford protection to birds but are not strictly game refuges. These are Antietam battle field, Guilford Courthouse, Gettysburg, and Lincoln's birthplace.

AGRICULTURAL STATISTICS

UNITED STATES DEPARTMENT OF AGRICULTURE YEARBOOK, 1925

Prepared under the direction of the Statistical Committee: W. F. Callander, Lewis B. Flohr, Joseph A. Becker, and G. B. L. Arner

INTRODUCTION

Statistics of acreage, yield per acre, and production in the United States are estimates made by the Division of Crop and Livestock Estimates. For the year 1909, acreages are as reported by the Bureau of the Census; acreages in 1919 are based upon the census, supplemented by State enumerations. Acreages in 1924 are revised to or toward the preliminary reports of the agricultural census of 1924. In the intercensal years from 1911 to 1915, estimated acreages were obtained by applying estimated percentages of decrease or increase to the published acreage in the preceding year. The estimates from 1915 to 1918, from 1919 to 1923, and for 1925 are based upon acreage changes from year to year as shown by a sample of approximately 2 per cent of the crop acreages in each year, supplemented by State enumerations. Yields per acre are estimates based upon reports of one or more farmers in each agricultural township, on the average yield per acre in their localities. Production is acreage times yield per acre. Production estimates are in some cases revised in the following year on the basis of State enumerations and record of shipments.

Estimates of farm stocks, shipments, quality, crop condition, and miscellaneous information concerning crops are based either upon sample data or upon estimates of crop reporters for their localities. The sources of these data are indicated in the notes accompanying the tables.

Estimated prices received by producers on the specified dates are based upon reports of farmers and country dealers on the average price paid to farmers, and do not relate to any specified grade. Farm value as shown is computed by applying the December 1 farm price to the total production. The average price received for the portion of the crop sold may be greater or less than this price, depending upon the price changes previous and subsequent to December 1 and the amount of the crop sold at the different prices.

Numbers of livestock on farms in 1910 correspond to the census enumeration as of April 15 in that year. The number on January 1, 1920, is based upon the census enumeration as of that date, supplemented by enumerations by State agencies, such as assessors and brand inspection boards and by records of shipments during 1920. The number on January 1, 1925, is revised to or toward the preliminary reports of the agricultural census of 1924, supplemented by enumerations by State agencies, such as assessor and brand inspection boards, and by records of shipments during 1925. In the intercensal years, from 1911 to 1916 the numbers of livestock were obtained by methods identical with those used for crop acreages. Estimates from 1917 to 1919, from 1920 to 1923, and for 1925 are based upon a sample of approximately 2 per cent, supplemented by trends derived from assessors' enumerations, reports of brand inspection boards, market movements, and stockyard receipts. The census bases are not always comparable from one decade to another, due both to changes of dates and classifications.

The average value per head on January 1 is estimated from reports of correspondents relating to livestock in their vicinity. These are inventory values as distinguished from the monthly prices which relate to sales. The farm value on January 1 is computed by applying the average value per head to the number of head on farms.

Certain statistics represent enumerations made by the department in connection with the administration of regulatory and inspection laws. Certain other statistics represent enumerations made by the department in compliance with general legislation authorizing the collection and dissemination of information on agricultural products.

Statistics relating to supplies, movements, and market prices of agricultural products in the United States are derived from official sources as far as available; otherwise from reliable unofficial sources. In all cases wherein the data presented did not cover the field or a major sample thereof, data most representative of the various commodities, movements, and markets have been selected.

With some crops marketing and movement into consumptive channels takes place entirely within the calendar year in which the crop was produced. For many crops marketing takes place during portions of two calendar years. For a few crops, as potatoes, marketing extends beyond a 12-month period. In order that the movement and prices of the particular crop may be followed through, the months in which the crop moved have been used as the "year." Estimated prices received by producers are indices of price trends rather than prices actually received.

Weighted averages of prices are shown in all cases where a weighting factor was available. For instance, the weighted price of wheat in Chicago is based on the number of carload sales reported, which range from 42 to 55 per cent of all receipts on that market. In the case of hogs at Chicago, the weighted average price is based on total sales of butcher hogs to slaughterers. With many commodities, however, data as to quantities sold are unobtainable; in all such cases average prices are based on price quotations without reference to quantity.

It should be remembered that, due to changes in market conditions or quality of delivery in different years on or under the same grade description or specifications, prices derived from different sources may not be strictly comparable, although for most general purposes they are entirely satisfactory. For instance, the changes in the description of many kinds of livestock which were made July 1, 1925, while not affecting certain price series; made others only fairly comparable and made comparison impossible in other cases. The data as to commercial stocks and movements of various commodities are as nearly complete as practicable and feasible, and are considered fairly representative.

Data originating with other departments and agencies are included because of their general interest to the agricultural industry. The sources of such data are given in connection with the tables. Care has been taken to quote only such sources as are generally considered reliable.

Statistics of acreage and production in foreign countries are compiled as far as possible from official sources and are therefore subject to whatever errors may result from shortcomings in the reporting and statistical services of the various countries. Inaccuracies also result from differences in nomenclature and classification in foreign countries, and through the conversion of foreign units into domestic equivalents. Except where otherwise stated, pre-war data refer to pre-war boundaries. Yields per acre are calculated from acreage and production, both rounded to thousand units, and are therefore subject to a greater possibility of error when calculated for countries with small acreage.

The tables of international trade cover substantially the international trade of the world. The total imports and the total exports in any one year can not be expected to balance, although disagreements tend to be compensated over a series of years. Among the sources of disagreement are: The different periods covered by the "year" of various countries; imports received in the year subsequent to the year of export; lack of uniformity in classification of goods as among countries; different trade practices and varying degrees of failure in recording countries of origin and ultimate destination; different practices in recording reexported goods; and different methods of treating free ports. The exports given are domestic exports and the imports given are imports for consumption, whenever it is possible to distinguish such imports from general imports. While there are some inevitable omissions, there may be some duplication because of reshipments which do not appear as such in the official reports. In the trade tables, figures for the United States include Alaska, Porto Rico, and Hawaii, but not the Philippine Islands.

Since the statistics for the current year are in many cases preliminary and subject to revision on the basis of later and fuller information, the reader is cautioned to use always the figures as they appear in the latest issue of the Yearbook. For many commodities, long-time tables appear in the Statistical Bulletin series of the department. Current information gathered by the department may be found in the current issues of the Monthly Supplement to "Crops and Markets," "Foreign Crops and Markets," and in various mimeographed or multigraphed releases. Current information gathered by other governmental agencies and by private agencies may be found in the current issues of reports by those agencies.

STATISTICS OF GRAINS

WHEAT

¹ Where changes in boundary have occurred as a result of the world war estimates have been adjusted to correspond with the area within the post-war boundaries.

² Four-year average.

³ One year only.

⁴ The estimate for the five-year period 1909-1913 given in this table is somewhat larger than the figures obtained by averaging those five years in Table 14. This is because in the detailed table estimates for warring countries are for postwar boundaries, whereas in Table 14 they are for prewar territory. As a result, in excluding Russia, which lost territory in the war, a smaller area is excluded in the detailed table than in Table 14.

⁵ Excluding Turkestan and Transcaucasia.

⁶ Three-year average.

Division of Crop and Livestock Estimates. Prior to 1918 stocks in mills and elevators not included.

¹ Based on percentage of crop as estimated by about 3,500 mill and elevator operators.² Based on percentage of crop on farms as estimated by crop reporters.³ Based on estimates of crop reporters on Nov. 1.⁴ Percentage of "a high medium grade" as estimated by crop reporters at time of harvest.⁵ Based on percentage shipped out as estimated by crop reporters.⁶ Preliminary.

Division of Statistical and Historical Research.

¹ The consumption figures in this column were obtained by a survey in 1911 by the Bureau of Crop Estimates.² The figures in this column shown for the individual States were computed on the ratio between the United States consumption in 1911 (5.31 bushels) and the per capita disappearance during the five years July, 1920-June 30, 1925 (4.701 bushels). The average disappearance for the latter period was 38.53 per cent of the 1911 disappearance.³ The seed requirements are based on the spring acreage of 1925 and the 1925 fall sowing according to the December, 1925, estimates. The rate of seeding in each State was applied to the acreage in that State.

¹ Division of Statistical and Historical Research.² Compiled from the annual reports of the Chicago Board of Trade to December, 1922. January, 1923, to date from the Chicago Daily Trade Bulletin. Reported on the Saturday nearest the first of the month. The Chicago Board of Trade "visible" includes grain stored east of the Rockies only. It covers 22 interior and seaboard points of large accumulation and grain in transit by canals and lakes.³ From the Chicago Daily Trade Bulletin.⁴ Compiled from Bradstreet's. Includes grain stored at approximately fifty interior and seaboard points of accumulation and grain in transit by canals and lakes; also Pacific coast stocks at Portland, Tacoma, and Seattle. Reported on the Saturday nearest the first of the month.

Division of Statistical and Historical Research for estimated production by classes; Grain Division for inspections of United States wheat for export.

¹ The spring and winter wheats listed do not include the spring and winter in the white wheats. Production estimates are based on the estimate of percentage classification by States as reported for 1920 and 1923 to the Division of Crop and Livestock Estimates; the percentages for 1921 and 1922 were interpolated from the 1920 and 1923 percentages. The estimated production for 1925 is based on 1923 percentages, and is subject to revision.

² White wheat in the Pacific Northwest region consists of both spring and winter wheat; no attempt has been made to classify this wheat as other than white wheat, part of which is spring and part winter.

³ From July 1, 1921, to June 30, 1923, 70 per cent of the exports of mixed wheat is estimated as durum.

⁴ Prior to July 1, 1923, practically all wheat exported from the Pacific coast was shipped on the basis of "Portland (Oreg.) Chamber of Commerce type sample." Since July 1, 1922, all wheat exported from the Pacific coast has been inspected on the basis of Federal grades and classes.

⁵ Exports of wheat other than reported as "Federal inspected."

Division of Statistical and Historical Research. Compiled from daily trade papers of markets named.

¹The prices in this table are comparable with farm prices in that the farm prices are averages of the several prices reported which cover all classes and grades sold from the farm.

²Average of daily prices weighted by car-lot sales.

Division of Statistical and Historical Research. Official sources and International Institute of Agriculture except as otherwise stated. Production as reported is for the calendar year in the Northern Hemisphere and the succeeding harvest in the Southern Hemisphere.

¹ Where changes in boundary have occurred averages are estimates of production within present boundaries.

² Estimated on basis of acreage and average yield of 8.9 bushels per acre.

³ Four-year average.

⁴ Excluding Turkestan and Transcaucasia.

⁵ The estimate for the five-year period 1909–1913 given in this table is somewhat larger than the figure obtained by averaging those five years in Table 52. This is because in the detailed table estimates for warring countries are for postwar boundaries, whereas in Table 52 they are for pre-war territory. As a result, in excluding Russia, which lost territory in the war, a smaller area is excluded in the detailed table than in Table 52.

⁶ Excluding Transcaucasia.

⁷ One year only.

⁸ Excludes a few minor producing countries which do not enter into world trade or for which no statistics are available.

Division of Statistical and Historical Research. Official sources and International Institute of Agriculture unless otherwise stated.
Average given is for crops harvested during the calendar year in the Northern Hemisphere and the succeeding harvest in the Southern Hemisphere.

¹ Where changes in boundaries have occurred as a result of the World War estimates have been adjusted to correspond with the area within the post-war boundaries.

* One year only.

* Four-year average.

* Two-year average.

* Excludes a few minor producing countries which do not enter into world trade and for which no production statistics are available.

Division of Statistical and Historical Research. Official sources and International Institute of Agriculture except as otherwise stated. Production as reported is for the calendar year in the Northern Hemisphere and the succeeding harvest in the Southern Hemisphere.

1 Two year average.

1 One year only.

1 Four-year average.

1 The estimate for the five-year period 1909-1913 given in this table is somewhat larger than the figure obtained by averaging those five years in Table 67. This is because in the detailed table estimates for warring countries are for postwar boundaries, whereas in Table 67 they are for pre-war territory. As a result, in excluding Russia, which lost territory in the war a smaller area is excluded in the detailed table than in Table 67.

1 Includes some sorghum.

1 Excludes China and a few minor producing countries which do not enter into world trade and for which no production statistics are available.

Division of Crop and Livestock Estimates.

¹ Based on reported percentage of entire crop on farms, proportion merchantable, and per cent shipped out of county where grown.

² 1909-10 to 1920-21, quality reported as per cent of a high medium grade; 1921-1925, per cent of merchantable quality.

³ Preliminary.

Division of Crop and Livestock Estimates. Figures in italics are census returns. Exports and imports from Commerce and Navigation of United States 1909-1918 and the June issue of Monthly Summaries of Foreign Commerce, 1919-1925.

¹ Based on Dec. 1 price.

² Chicago Daily Trade Bulletin. Quotations are for contract 1909-1915.

³ Oatmeal not included in 1909.

⁴ Preliminary.

Division of Statistical and Historical Research. Official sources and International Institute of Agriculture, except as otherwise stated. Production as reported is for the calendar year in the Northern Hemisphere and the succeeding harvest in the Southern Hemisphere.

* One year only.

* Four-year average.

* The estimate for the five-year period 1909-1913 given in this table is somewhat larger than the figure obtained by averaging those five years in Table 91. This is because in the detailed table estimates for warring countries are for postwar boundaries, whereas in Table 91 they are for pre-war territory. As a result, in excluding Russia, which lost territory in the war, a smaller area is excluded in the detailed table than in Table 91.

* Excluding Turkestan and Transcaucasia.

* Excluding Transcaucasia.

* Three-year average.

* Excluding native locations which produced 299,644 bushels in 1917-18 and 67,270 bushels in 1920-21.

* Excludes a few minor producing countries which do not enter into world trade or for which no estimates are available.

TABLE 91.—Oats: World production, 1909–1925

Division of Statistical and Historical Research. Official sources and International Institute of Agriculture except as otherwise stated. Production as reported is for the calendar year in the Northern Hemisphere and the succeeding harvest in the Southern Hemisphere.

¹ Where changes in boundaries have occurred averages are estimates for territory in present boundaries.

² One year only.

³ Four-year average.

⁴ The estimate for the five-year period 1909-1913 given in this table is somewhat larger than the figure obtained by averaging those five years in Table 112. This is because in the detailed table estimates for warring countries are for postwar boundaries, whereas in Table 112 they are for pre-war territory. As a result in excluding Russia, which lost territory during the war, a smaller area is excluded in the detailed table than in Table 112.

⁵ Excluding Turkistan and Transcaucasia.

⁶ Excludes native locations which produced 38,560 bushels in 1917-18 and 20,057 bushels in 1920-21.

⁷ Two-year average.

⁸ Excludes a few minor producing countries which do not enter into world trade or for which no statistics are available.

TABLE 112.—*Barley: World production, 1909-1925*

[Thousand bushels—1. e., 000 omitted]

Division of Statistical and Historical Research. Official sources and International Institute of Agriculture except as otherwise stated. Estimates given are for crops harvested during the calendar year in the Northern Hemisphere and the succeeding harvest in the Southern Hemisphere with the exception of India. See note on India.

¹ Where changes in boundary have occurred averages are estimates for territory within present boundaries.

² Three-year average.

³ Two-year average.

⁴ Four-year average.

⁵ One year only.

⁶ Acreage of crop sown in autumn of year given and harvested in the spring of the succeeding year.

⁷ Excludes a few minor producing countries which do not enter into world trade and for which no acreage or production estimates are available.

| Estimated world total ² | 111,500 | 102,800 | 122,500 | 134,400 | | 1,194,000 | 1,082,000 | 941,000 | 1,075,000 | |

Division of Statistical and Historical Research. Official sources and International Institute of Agriculture except as otherwise stated. Estimates given are for crops harvested during the calendar year in the Northern Hemisphere and the succeeding harvest in the Southern Hemisphere with the exception of India. See note on India.

¹ Where changes in boundary have occurred averages are estimates for territory within present boundaries.

² Four-year average.

³ Two-year average.

⁴ Excludes a few minor producing countries which do not enter into world trade and for which no acreage or production statistics are available.

Division of Statistical and Historical Research. Compiled from reports of the Bureau of Foreign and Domestic Commerce and Division of Crop and Livestock Estimates.

¹ Oil converted to seed on basis of 7½ pounds to a gallon and 2½ gallons of oil to the bushel.

² Preliminary.

Less than 500 bushels for the 6 months ended Dec. 31, 1922; not separately reported since that date.

³ Not separately reported.

⁴ Represents domestic oil only. Exports of "foreign" linseed oil not separately reported since December, 1922, but included with exports of "other vegetable oils" (foreign) n. e. s. Exports of "foreign" linseed oil for the 6 months ended Dec. 31, 1922, were the equivalent of 260 bushels of flaxseed.

Division of Statistical and Historical Research. Figures for 1910-1915 from Monthly Labor Review; 1916-1918 from War Industries Board Price Bulletin; 1919-1925 from Oil, Paint, and Drug Reporter, average of weekly range.

¹ Beginning October, 1925, prices were quoted on pound basis and have been converted to price per gallon by multiplying by 7.5.

Division of Crop and Livestock Estimates. Figures in italics are census returns.

1 Based upon farm price Dec. 1.

2 Commerce and Navigation of United States, 1900-1918, and the June issue of Monthly Summaries of Foreign Commerce, 1919-1925. Domestic exports here include also shipments from the United States to Porto Rico and Hawaii; net imports are total imports minus reexports. Bushels are computed from pounds as reported in original by assuming 1 bushel of rough rice to yield 27½ pounds of cleaned rice.

3 Preliminary.

¹ Averages for European countries are estimates for the territory within present boundaries.² Three years only.³ One year only.⁴ Four years only.⁵ Less than 500 acres.⁶ Pre-war average.⁷ Two years only.⁸ Total acreage estimated from area under summer or main crop which was 91,000 acres this year compared with 231,000 in 1924. The acreage under this crop in 1924 was 90 per cent of the total acreage under rice in Egypt.⁹ Total acreage estimated from that under rice in Annam, Cambodia, Laos, Tonking, and Cochin-China which was estimated at 9,197,400 acres in 1925 compared with 9,064,000 in 1924. In 1924 the acreage in these provinces comprised 76.9 per cent of the acreage under rice in Indo-China.

Division of Statistical and Historical Research. Official sources and International Institute of Agriculture. Production figures in most cases are for crops harvested in the calendar year in the Northern Hemisphere and the succeeding harvest in the Southern Hemisphere.

¹ Averages for European countries are estimated for territory within present boundaries.

² Two years only.

³ One year only.

⁴ Total production estimated from production reported in Annam, Laos, Cochin-China and the first crop in Cambodia and Tonking, aggregating 5,355,734,000 pounds in 1925 compared with 5,846,079,000 in 1924. In 1924 the production in these provinces amounted to 74.4 per cent of the total crop produced in Indo-China.

⁵ Production estimated by multiplying acreage by an average yield for years 1920–21 to 1923–24 for which years the Ministry of Lands and Agriculture gives official estimates of both area and production.

⁷ Unofficial.

⁸ Three-years only.

⁹ Rough estimate for nonirrigated crop also included in total.

¹⁰ Unofficial estimates of the Chinese crop are as follows: 70,219,000,000 pounds in 1917; 52,788,000,000 in 1920 and 50,056,000,000 in 1923.

Division of Statistical and Historical Research. The figures for each year include the crop harvested in the Northern Hemisphere within the calendar year and the following harvest in the Southern Hemisphere.

¹ Includes India, Japan, Java and Madura, Formosa, Italy, Spain, and Dutch Guiana.

² Revised figures based on additional information since the publication of the 1924 Yearbook of the United States Department of Agriculture due principally to changes in the figures for Java and Madura and Siam.

³ China would rank among the chief producing countries, but owing to lack of official statistics has been omitted.

⁴ Irrigated rice. The changes in the figures for Java and Madura from those previously reported are based on official information recently received as to the percentage of cleaned rice obtained from paddy and rough rice.

⁵ Estimated figures obtained by multiplying acreage under rice as classified for revenue purposes up to 1912 and acreage as reported by the Department of Land and Agriculture from 1912 on by an average yield for the years 1920-1923 for which years official estimates have been published of areas, yield, and total production.

* Estimated.

Division of Statistical and Historical Research. Official sources except where otherwise noted.

Mostly cleaned rice. Under rice is included paddy, unhulled, rough, cleaned, polished, broken and cargo rice, in addition to rice flour and meal. Rice bran is not included. Rough rice, or paddy, where specifically reported, has been reduced to terms of cleaned rice at the ratio of 162 pounds of rough or unhulled to 100 pounds of cleaned. "Rice, other than whole or cleaned rice," in the returns of the United Kingdom is not considered paddy, since the chief sources of supply indicate that it is practically all hulled rice. Cargo rice, a mixture of hulled and unhulled, is included without being reduced to terms of cleaned. Broken rice and rice flour and meal are taken without being reduced to terms of whole cleaned rice.

1 Three-year average.

2 Twelve months' sea-trade, three months' land-trade.

3 International Institute of Agriculture.

4 Java and Madura only.

5 Two-year average.

6 One year only.

Division of Crop and Livestock Estimates.

¹ The percentages shown are the percentages of the various apple crops reported by the growers to be of summer varieties, such as ordinarily go into consumption not later than early September, fall and early winter varieties not suitable for keeping later than Christmas; and later varieties, including those which can ordinarily be stored for winter use.

Cold Storage Report Section.

¹ All apples, except those packed in western-style boxes, are tabulated in terms of barrels, on the basis of 3 bushels to the barrel; since Oct. 1, 1923, apples packed in bushel baskets are also included in this tabulation. Three boxes are considered the equivalent of 1 barrel.

Division of Crop and Livestock Estimates.

¹ *Production*.—For Florida the estimates for 1919 and more recent years represent shipments by rail or boat. For other States the figures aim to include all fruit actually picked, however utilized, but do not include fruit which matured on the trees but was not picked because of freezing, dropping, or low prices. For California the figures relate to the crop produced from the bloom of the year shown, fruiting through the winter and through the spring and summer of the following year, being picked from Nov. 1 of the year shown to Oct. 31 of the following year. Fruit not picked till after the latter date is included with the crop of the following year. For other States, the estimates include fruit picked after about Sept. 1 of the year shown. For the crop of 1925 the estimates shown were based on prospects on Dec. 1, 1925, except where shown otherwise.

² Including tangerines.

³ Data from census reports.

⁴ Compiled from records of Division of Crop and Livestock Estimates.

⁵ Revised February, 1926.

⁶ Less than 500 boxes.

Division of Crops and Livestock Estimates.

¹ The figures shown are approximate only. They are intended to represent the numbers of citrus trees on farms and old enough to produce fruit in the year shown. The figures no doubt include some small trees producing a negligible quantity of fruit. The enumerators of the 1910 and 1920 censuses asked for orange trees and also for other subtropical fruits. In this table tangerine trees have been included with other orange trees. The enumerators of the 1925 census asked only for the number of orange trees, and the figures may include only part of the tangerine trees. In addition to the numbers shown there are in some sections a considerable number of trees on properties that were not listed as farms by the Census Bureau.

² Including tangerine trees.

³ Data from census reports.

⁴ From records of the Division of Crop and Livestock Estimates.

⁵ Less than 500 trees.

⁶ Preliminary report of 1925 census not yet available.

Division of Statistical and Historical Research. Compiled from reports of Fruit and Vegetable Division. Shipments as shown in car lots include those by boat reduced to car-lot basis.

¹ Crop movement season extends from Sept. 1, of one year through September of the following year, except for oranges in California, where the season extends from November 1 to October.

² Preliminary.

³ Includes 1 car from Alabama.

⁴ Includes tangerines.

⁵ Includes 1 car in August, 1921.

| 1925..... | 1,817,000 | 30.00 | 54,510,000 | | | | |

¹ To calculate the production of pears, peaches, apricots, and plums in bushels, multiply the production in tons by 2,000 (the number of pounds in a ton) and divide by 48, the usual number of pounds in a bushel.

² Dried basis. To calculate in terms of fresh fruit multiply the quantity of dried prunes produced by 2½.

³ The production shown includes a small quantity of prune varieties shipped fresh, but does not include prunes dried.

⁴ Dried basis. To calculate the approximate quantity of fresh grapes used for raisins multiply the production of raisins by 4.

⁵ For years prior to 1923 the quantity of raisins marketed fresh was small and has been included with other table grapes.

⁶ Representing the commercial crop year beginning Nov. 1 of the year shown; the numbers for 1925, for instance, represent the fruit that set during the season of 1925 and will be picked and marketed from Nov. 1, 1925, to Oct. 31, 1926.

Division of Statistical and Historical Research. Compiled from Daily Market Report of Fruit and Vegetable Division.

Average prices as shown are based on stock of good merchantable quality and condition; they are simple averages of daily range of selling prices. In some cases conversions have been made from larger to smaller units or vice versa, in order to obtain comparability.

¹ Quotations began Mar. 17, 1921; Mar. 23, 1922; Mar. 28, 1923; Mar. 31, 1924; Mar. 19, 1925.

² Last reported quotations of season June 3, 1921; June 6, 1922; June 13, 1923; June 17, 1924; June 9, 1925.

Division of Statistical and Historical Research. Compiled from reports of Fruit and Vegetable Division. Shipments as shown in car lots include those by boat reduced to car-lot basis.

¹ Crop movement season for cabbage becomes important in the South in January and continues for 16 months ending in April with final shipments from northern points.

² Preliminary.

³ New York includes 1 car in May, 1923.

⁴ Figures for certain States include in the January shipments, cars moved in preceding calendar year as follows—1920: Florida, 10 cars in December; Louisiana, 4 cars in December; Texas, 2 cars in November, 23 in December. 1921: Florida, 1 car in October, 1 in November, 13 in December; South Carolina, 2 cars in December; Texas, 25 cars in December. 1922: Alabama, 1 car in December; Florida, 15 cars in December; South Carolina, 1 car in November, 32 in December; Texas, 4 cars in November, 110 in December. 1923: Alabama, 3 cars in December; Florida, 19 cars in December; Louisiana, 2 cars in November, 13 in December; South Carolina, 11 cars in November, 152 in December; Texas, 22 cars in November, 39 in December. 1924: Florida, 72 cars in December; Louisiana, 1 car in November, 7 in December; South Carolina, 24 cars in November, 167 in December; Texas, 9 cars in November, 64 in December.

Division of Statistical and Historical Research. Compiled from Daily Market Report of Fruit and Vegetable Division. Average prices as shown are based on stock of good merchantable quality and condition; they are simple averages of daily range of selling prices. In some cases conversions have been made from larger to smaller units or vice versa, in order to obtain comparability.

- † Unless otherwise stated, quotations are on bulk per ton sales.
- ‡ The season during which Danish cabbage prices are obtainable usually runs from October to March of the following year.
- § Sacked per ton delivered.
- ¶ Converted from hundredweight prices.
- * Bulk per hundredweight.
- Converted from ton prices.
- † Quar-lot sales.

Division of Statistical and Historical Research. Compiled from Daily Market Report of Fruit and Vegetable Division.

Average prices as shown are based on stock of U. S. No. 1 grade; they are simple averages of daily range of selling prices. In some cases conversions have been made from larger to smaller units or vice versa, in order to obtain comparability.

¹ Quotations began Aug. 23, 1920; Aug. 22, 1921; Aug. 7, 1922; Aug. 14, 1923; Aug. 23, 1924; July 23, 1925.

² Last reported quotations of season June 11, 1921; June 14, 1922; May 29, 1923; June 4, 1924; June 10, 1925.

Division of Statistical and Historical Research. Official sources and the International Institute of Agriculture except as otherwise stated. Estimates given are for crops harvested during the calendar year in the Northern Hemisphere and the succeeding harvest in the Southern Hemisphere.

¹ Averages for countries having changed boundaries are estimates for territory within present boundaries.

* Two-year average.

* One year only.

* Does not include Transcaucasia and Turkestan.

Division of Statistical and Historical Research. Compiled from reports of Fruit and Vegetable Division. Shipments as shown in car lots include those by boat reduced to car-lot basis.

¹ Crop movement season extends from April 1 of one year through July of the following year, except in Florida where the season begins in March.

² Preliminary.

³ Includes 8 cars in August, 1923.

⁴ Includes 1 car in February, 1922.

⁵ Includes 28 cars in February, 1925.

⁶ Includes 32 cars in March, 1921.

⁷ Includes 11 cars in March, 1925.

⁸ Includes 1 car in February, 1922, and 8 in August, 1923.

⁹ Includes 28 cars in February and 11 in March, 1925.

Division of Statistical and Historical Research. Compiled from Daily Market Report of Fruit and Vegetable Division. Average prices as shown are based on stock of U. S. No. 1 grade; they are simple averages of daily range of selling prices. In some cases conversions have been made from larger to smaller units or vice versa, in order to obtain comparability.

¹Crop movement season extends from April of one year through May of the following year, with irregular quotations continuing through June and July.

²Car-lot sales.

³Eight-day average.

⁴Bulk only.

Division of Statistical and Historical Research. Compiled from reports of Fruit and Vegetable Division. Shipments as shown in car lots include those by boat reduced to car-lot basis.

¹ Crop movement season extends from July 1 of one year through June of the following year.

² Preliminary.

³ Figures for certain States include shipments in July of succeeding crop year as follows: New Jersey—1920 15 cars; 1922, 4 cars; 1924, 4 cars, Arkansas—1921, 1 car; Kentucky—1921, 1 car; New Mexico—1921, 5 cars; Tennessee—1921, 17 cars; 1924, 3 cars.

⁴ Florida includes 2 cars in June, 1922.

Division of Statistical and Historical Research. Compiled from Daily Market Report of Fruit and Vegetable Division.

Average prices as shown are based on stock of good merchantable quality and condition; they are simple averages of daily range of selling prices. In some cases conversions have been made from larger to smaller units or vice versa, in order to obtain comparability.

¹ Quotations began Aug. 23, 1920 and 1921; Sept. 1, 1922; Sept. 18, 1923; Sept. 2, 1924; Aug. 25, 1925.

² Last reported quotations of season May 26, 1921 and 1922; May 4, 1923; April 15, 1924; April 3, 1925.

Division of Statistical and Historical Research. Official sources and International Institute of Agriculture except as otherwise stated. Data for crop year as given at the head of the tables are for crops harvested between about August 1 and July 31 of the following year. This applies to both Northern and Southern Hemispheres. For the United States prior to 1914 the figures apply to the harvest year beginning September 1.

¹ Third estimate. In the past 12 years the third estimate has averaged 95 per cent of the final estimate.² Average for three years.³ Average for four years.⁴ Average for 1914-15 to 1918-19.

Division of Statistical and Historical Research. Bales of 478 pounds net. Data for crop year as given are for crops harvested between about Aug. 1 and July 31 of the following year. This applies to both Northern and Southern Hemispheres. For the United States prior to 1914 the figures apply to the year beginning Sept. 1.

¹ Figures as reported by the United States Bureau of the Census, including "the cotton destined to enter commercial channels for factory purposes." Estimates of the commercial crop in China are included.

² Chinese Cotton Mill Owners' Association. Figures represent the crop in the most important cotton producing Provinces where the commercial crop is grown. Cotton in other Provinces is used entirely or almost entirely for home hand-loom consumption.

Division of Statistical and Historical Research. Official sources except where otherwise noted. Bales of 500 pounds gross weight or 478 pounds net. The figures for cotton refer to ginned and unginned cotton and hnters, but not to mill waste, cotton batting, scarto (Egyptian and Sudan). Wherever unginned cotton has been separately stated in the original reports it has been reduced to ginned cotton in this statement at the ratio of 3 pounds unginned to 1 pound ginned.

1 Less than 500 bales.

2 Year ended Dec. 31.

3 International Institute of Agriculture, 7

4 Eleven months.

5 Sea-trade only.

6 Three-year average.

Division of Statistical and Historical Research. Official sources except where otherwise noted. Includes shelled and unshelled, assuming the peanuts to be unshelled unless otherwise stated. When shelled nuts were reported, they have been reduced to terms of unshelled at the ratio of 3 pounds unshelled to 2 pounds shelled.

¹ Java and Madura only.

² Two-year average.

³ Six months.

⁴ International Institute of Agriculture, Oleaginous Products and Vegetable Oils.

⁵ Three-year average.

⁶ One year only.

⁷ Reports include some sesamum.

Division of Crop and Livestock Estimates.

¹ Acreage and production of beets are credited to the State in which the beets are made into sugar. Year shown is that in which beets were grown. Sugar-making campaign extends into succeeding year.

² The planted acreage is that covered by factory-contract agreements and understandings, all of which is not actually planted by growers. Therefore abandonment may not mean actual loss of acreage.

³ Preliminary.

TABLE 402.—Beet sugar: Production by States, 1922-1925, United States, 1914-1925

Division of Crop and Livestock Estimates. Figures for 1925 are preliminary.

¹ Acreage and production of beets are credited to the State in which the beets are made into sugar. Year shown is that in which beets were grown. Sugar-making campaign extends into succeeding year.

² Based upon weight of beets.

³ Percentage of sucrose (pure sucrose) in the total soluble solids of the beets.

⁴ Percentage of sucrose actually extracted by factories.

⁵ Percentage of sucrose (based upon weight of beets) remaining in molasses and pulp.

⁶ Preliminary.

Division of Statistical and Historical Research. See Table 405 for source of production figures. Trade figures, Bureau of Foreign and Domestic Commerce.

¹ In terms of raw sugar.

² Beet and cane sugar only.

³ Duty free. From Hawaii, Porto Rico, and the Philippine Islands (Virgin Islands included 1917 and subsequently).

⁴ No account taken of sugar imported in other forms. Imports from Philippine Islands excluded, re-exports deducted.

⁵ Shipments to Hawaii and Porto Rico included. Direct exports to foreign countries from Hawaii and Porto Rico excluded.

⁶ Sugar used in the manufacture of other commodities for export on which drawback was paid.

⁷ No account taken of stocks at beginning or end of the year.

Division of Statistical and Historical Research. Official sources and International Institute of Agriculture except as otherwise stated.

¹ Averages for countries having changed boundaries are estimates for territory within present boundaries.

² Principal producing States.

³ Two year average.

⁴ One year only, 1912-13. According to statistics of the German sugar association, the 1912-13 acreage was higher than any other year with the exception of 1914-15.

⁵ Four-year average.

⁶ No sugar beets grown for sugar previous to 1918.

Division of Statistical and Historical Research.

¹ Figures are for the crop years 1909–10 to 1925–26 for the countries in which the sugar harvesting season begins in the fall months and is completed during the following calendar year, except in the case of cane-sugar producing countries where the season begins in May or June and is completed in the same calendar year. Production in these countries is for the calendar years 1909 to 1925.

² The figures quoted are the production of gur, a low grade of sugar which is mostly consumed by the natives.

³ All grades of sugar reduced to terms of head sugar.

Division of Statistical and Historical Research. Official sources and International Institute of Agriculture except as otherwise stated.

Figures are for the crop years 1909-10 to 1925-26 for the countries in which the sugar harvesting season begins in the fall months and is completed during the following calendar year, except in the case of cane-sugar producing countries where the season begins in May or June and is completed in the same calendar year. Production in these countries is for the calendar years 1909 to 1925.

¹ Unofficial estimate.

² Exclusive of production in minor production countries for which no data are available.

¹² Too small to report.

¹³ The figures quoted are the production of gur, a low grade of sugar which is mostly consumed by the natives. There are 23 modern factories in India which make sugar direct from cane. These factories produced 38,000 short tons refined sugar in 1924-25 as compared with 43,000 short tons in 1922-24. The decrease, according to the secretary of the sugar bureau, was due to inadequate supply of raw material and the higher price of gur, which induced the peasants to prefer making gur to selling cane to factories.

¹⁴ Three-year average.

Hay, Feed, and Seed Division.

¹Imports of all seeds up to and including the fiscal year 1913, also of perennial and Italian rye grass and hairy vetch up to and including 1917, and sweet clover for all years, are based on information furnished by U. S. Customs Service. All other figures represent imports of seed permitted entry under the seed importation act.

²Less than 500 pounds.

³Figures missing.

¹ Averages for European countries are estimates for territory within present boundaries.

² 2-year average.

³ Unofficial estimate.

⁴ 3-year average.

⁵ 1-year average.

⁶ 4-year average.

⁷ Includes Asiatic Russia.

⁸ Incomplete data, yellow tobacco only. According to another source the total production of both yellow tobacco and mahorka in 1924 amounted to 43,335,000 pounds.

⁹ Rough estimate of annual production.

¹⁰ Lebanon only. According to the International Institute of Agriculture this district produced 1,102,000 pounds in 1922, 882,000 in 1923, and 1,587,000 pounds in 1924.

¹¹ Exclusive of Aleppo.

¹² Exclusive of Tonking.

| Estimated world total exclusive of India and China ¹⁵ | 2,671,000 | 2,568,000 | 2,996,000 | 3,110,000 | |

Division of Statistical and Historical Research. Official sources and International Institute of Agriculture except as otherwise stated. Production figures are for the crop harvested in the calendar year in the Northern Hemisphere and the succeeding harvest in the Southern Hemisphere.

¹ 3-year average.² 1 year only.³ 4-year average.

¹² The figures quoted here include a rough estimate of the crops produced by natives, on the basis of an average yield of 4 piculs per bouw (311 pounds per acre), as quoted by Trade Commissioner J. F. Van Wickel, Batavia, Java, to which is added the official estimate of production by Europeans.

¹⁴ Exclusive of Victoria.

¹⁵ No reliable data is available on production in India or China. The acreage devoted to tobacco in India would indicate a production next to the United States in the size of the crop. China is also of considerable importance.

Division of Statistical and Historical Research. Compiled from official sources except where otherwise noted. The item coffee comprises unhulled and hulled, ground or otherwise prepared, but imitation or "surrogate" coffee and chicory are excluded.

¹ Four-year average.

² International Institute of Agriculture.

³ Java and Madura only.

⁴ Three-year average.

⁵ One year only.

⁶ Less than 500 pounds.

⁷ Six months.

⁸ Reexports in excess of imports.

⁹ Chiefly from Porto Rico.

¹ Average for 5-year period immediately preceding war if available, otherwise for any years within this period, except as otherwise stated. In countries having changed boundaries the figures are estimates for one year only of numbers within present boundaries.

² Revised estimates of Division of Crop and Livestock Estimates, 1921-1926. These figures are made on the basis of census figures of 1920 and 1925, of annual assessment data and other information. The estimates prepared in the Bureau of Animal Industry by adjustment of the census figures to a January 1 basis and including all animals in towns and villages as well as on farms and ranges are as follows: Average, 58,900; 1921, 67,200; 1922, 67,700; 1923, 68,900; 1924, 68,200; and 1925, 66,600.

³ Year 1902.

⁴ Year 1918.

⁵ Year 1908.

⁶ Year 1920.

⁷ Unofficial.

⁸ Year 1917.

⁹ Buffaloes included.

¹⁰ Year 1916.

¹¹ June, 1914.

¹² Numbers in rural communities only.

¹³ Year 1917.

¹⁴ Year 1906.

¹⁵ Estimated for present boundaries. The estimate for former boundaries on Apr. 6, 1918, is 6,239,741.

¹⁶ No census was made as of December, 1923, which estimate would have been considered as of January, 1924, in this table, as explained in the general note, so the figure for October, 1923, has been used.

Division of Statistical and Historical Research. Census returns are in italics; other returns in roman. All estimates for countries reporting as of December have been considered as of January of the following year.

⁶ Year 1920.

⁹ Buffaloes included.

¹⁰ Year 1916.

¹¹ Year 1915.

¹² Excludes southern territory where there were 15,580 cattle in 1923.

¹³ In addition there were 832,163 buffaloes.

¹⁴ Excludes Transcaucasia and Turkestan. The number in Turkestan and Azerbaijan (part of Transcaucasia) in 1920 amounted to 2,048,000.

Division of Statistical and Historical Research. Prior to 1915 receipts compiled from yearbooks of stockyard companies; subsequent figures compiled from data of the reporting service of the Division of Livestock, Meats, and Wool. Prior to 1915 shipments compiled from yearbooks of stockyard companies, except East St. Louis (1909 to 1914, from Merchants Exchange Annual Report); subsequent figures from data of the reporting service of the Division of Livestock, Meats, and Wool.

¹ Figures not available prior to 1915.

Division of Statistical and Historical Research.

Figures prior to July, 1920, for good beef steers, and prior to June, 1918, for calves, compiled from Chicago Drovers Journal Yearbook; subsequent figures compiled from data of the reporting service of the Division of Livestock, Meats, and Wool.

¹ Bulk of sales, 1,100 pounds up. July 1, 1925 classification changed to 1,100-1,500 pounds.

² Simple average of monthly average prices.

Division of Statistical and Historical Research. Calculated from quotations in the Review of the River Plate. Prices prior to May, 1924, originally quoted on basis of price per head supplemented from 1916 by price per pound of dressed carcass weight. Calculations assume average dressed weight of 730 pounds or live weight of 1,250 pounds. Live-weight quotations per pound from May, 1924. Converted from Argentine currency at average monthly rate of exchange.

Division of Statistical and Historical Research. Inspected slaughter from reports of Bureau of Animal Industry. Weights and storage holdings from reports of the Cold Storage Report Section; receipts, shipments, and prices compiled from data of the reporting service of the Division of Livestock, Meats, and Wool, and number on farm from Division of Crop and Livestock Estimates. Exports and imports from Bureau of Foreign and Domestic Commerce.

¹ Figures do not check to total because of adjustment to thousands.

² Weighted average, not total.

³ Simple average, not total.

⁴ Including reexports.

⁵ At public stockyards.

TABLE 480.—Beef: Yield of standard wholesale cuts in percentage of carcass, according to commercial grade ¹

Bureau of Home Economics. Figures are based on data published by Missouri and Illinois Agricultural Experiment Stations.

¹ Standard Chicago cuts were used. Except for slight differences, particularly in the fore quarter, these cuts correspond to the ones illustrated in U. S. Dept. Agr., Circ. 300, "Commercial Cuts of Meat." Figures refer to typical animals of each grade.

² Shoulder clod is included.

Division of Statistical and Historical Research. Official sources, except where otherwise stated.

Butter includes all butter made from milk, melted and renovated butter, but does not include margarine, cocoa butter or ghee.

1 Year beginning July 1.

2 International Institute of Agriculture.

3 Less than 500 pounds.

4 Two-year average.

5 Four-year average.

6 Java and Madura only.

7 Six months.

¹ A average for 5-year period immediately preceding war if available, otherwise for any years within this period except as otherwise stated. In countries having changed boundaries the figures are estimates for one year only of numbers within present boundaries.

² Revised estimates of Division of Crop and Livestock Estimates, 1921-1926. These figures are made on the basis of census figures of 1920 and 1925, of annual assessment data and other information. The estimates prepared in the Bureau of Animal Industry by adjustment of the census figures to a Jan. 1 basis and including all animals in towns and villages as well as on farms and ranges are as follows: Average 59,300; 1921, 58,600; 1922, 60,900; 1923, 71,600; 1924, 69,100; 1925, 56,700.

³ Year 1902.

⁴ Year 1920.

⁵ Year 1908.

⁶ Year 1916.

⁷ June, 1914.

⁸ Number in rural communities.

⁹ September.

¹⁰ Year 1906.

¹¹ Year 1918.

¹² Estimated for present boundaries. The number within former boundaries on Apr. 6, 1918, amounted to 2,338,926.

¹³ No census was made in December, 1923, which estimate would have been considered as of January 1924, in this table as explained in the general note, so the figure for October, 1923, has been used.

¹⁴ Unofficial.

Division of Statistical and Historical Research. Census returns are in *italics*; other returns in *roman*. All estimates for countries reporting as of December have been considered as of January of the following year.

¹⁸ Year 1915.

¹⁸ Excludes Transcaucasia and Turkestan. The number in Turkestan and Azerbaijan (part of Transcaucasia) in 1920 amounted to 102,000.

Division of Crop and Livestock Estimates. Based on reports of about 140,000 farmers gathered in cooperation with Post Office Department through the rural mail carriers. Periods covered: Dec. 1 to June 1 (spring), June 1 to Dec. 1 (fall).

- † Total pigs saved divided by sows farrowed as reported by farmers.
 ‡ Intentions are as of the close of the preceding 6-months' period; for example, those for spring farrowing 1926 were intentions expressed as of Dec. 1, 1925.
 § Total of 12 States immediately preceding, i. e. Ohio to Kansas.
 ¶ Not including North Dakota.

Division of Statistical and Historical Research. Compiled from Return of Market Prices, Great Britain Ministry of Agriculture and Fisheries. Average for the last week of the month 1909-1923; subsequently monthly average of weekly quotations. Converted to cents per pound on the basis of the monthly average rate of exchange as given in Federal Reserve Bulletins.

¹Short cut, regular American commercial ham; long cut, longer both in the butt and shank. Green, cured in pickle or salt but not smoked.

²Average of London and Bristol prices, and closely approximates Liverpool price.

Bureau of Animal Industry.

NOTE.—Owing to the emergency created by the outbreak of foot-and-mouth disease in Texas and California, it was necessary to assign many of the veterinarians from the hog-cholera force to the eradication of foot-and-mouth disease for a part of the year.

¹ Fractions denote veterinarians devoting a part of their time to the work.

¹ Average for 5-year period immediately preceding war if available, otherwise for any year within this period except as otherwise stated. In countries having changed boundaries the figures are estimates for one year only of numbers within present boundaries.

² Revised estimates of the Division of Crop and Livestock Estimates 1921-1926. These figures are made on the basis of census figures of 1920 and 1925, of annual assessment data and other information. The estimates prepared in the Bureau of Animal Industry by adjustment of the census figures to a January 1 basis and including all animals in towns and villages as well as on farms and ranges are as follows: Average, 58,900; 1921, 67,200; 1922, 67,700; 1923, 68,900; 1924, 68,200; and 1925, 66,000.

³ Year 1902.

⁴ Year 1916.

⁵ Year 1920.

⁶ Year 1908.

⁷ Year 1915.

⁸ June 1914.

⁹ Numbers in rural communities only.

¹⁰ September.

¹¹ Year 1906.

¹² Year 1918.

¹³ Estimated for present boundaries. The number in former boundaries on Apr. 6, 1918, was 11,753,910. No census was made as of December, 1923, which estimate would have been considered as of January, 1924, in this table as explained in the general note, so the figure for October, 1923, has been used.

¹⁴ Unofficial.

¹⁵ Goats included.

Division of Statistical and Historical Research. Census returns are in italics; other returns are in Roman. All estimates for countries reporting as of December have been considered as of January of the following year.

¹ 1920.⁷ 1915.¹⁰ Unofficial.¹¹ Goats included.¹⁷ Sheep one year and above. It is stated that 30 per cent may be added for those under that age.¹⁸ Excludes Turkestan and Transcaucasia. The number in Turkestan and Azerbaijan (part of Transcaucasia) in 1920 amounted to 4,745,000 sheep and 1,663,000 goats.
